1.0 SCOPE

This specification applies to VFD module (Model NO: M0420SD-204SDAR1-3) .

2.0 GENERAL DESCRIPTION

2.1 This specification becomes effective after being approved by the purchaser.
2.2 When any conflict is found in the specification, appropriate action shall be taken upon agreement of both parties.
2.3 The expected necessary service parts should be arranged by customer before the completion of production.

3.0 FEATURES

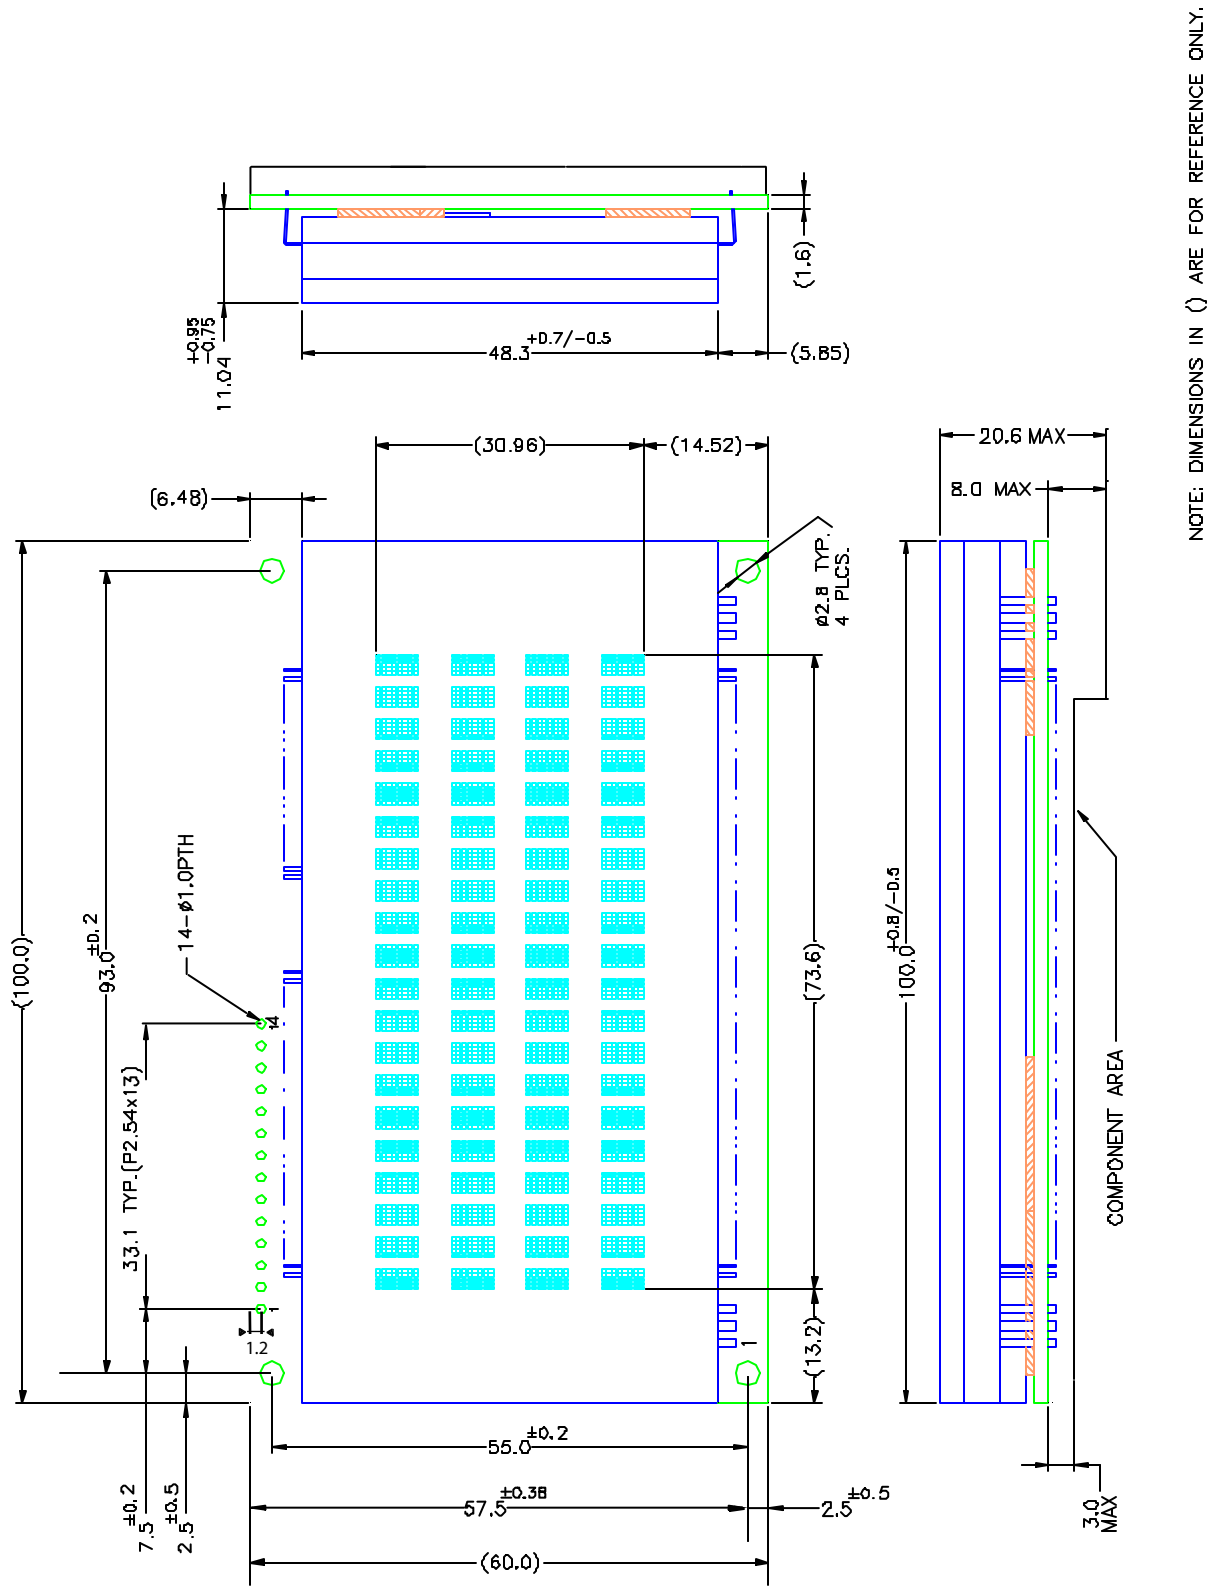
3.1 Four lines 5 x 8 dot matrix display, DC-DC/AC converter and controller/driver circuitry.
3.2 One chip controller mounted on the module includes the character generator ROM(CG-ROM) of 240 5 x 8 characters.
3.3 The module can be configured for a Motorola M68-type parallel interface, an Intel I80-type parallel interface, or a synchronous serial interface.
3.4 The luminance level of the VFD can be varied by setting two bits in the function set instruction, which are "don't care" bits for the module.
3.5 The module has a dual-port RAM that allows data and instructions to be sent to them continuously. Thus, the busy flag is always 0 and the host never has to read the busy flag bit to determine if the module is busy.
3.6 High quality green vacuum fluorescent display provides an attractive and readable medium. Other colors can be achieved by simple wavelength filters.
3.7 The module has up to 8 user definable characters. (CG-RAM function)
3.8 Newhaven Display reserves the right to change or modify this display design in order to improve the design.

4.0 SPECIFICATIONS

4.1 GENERAL SPECIFICATIONS

Number of characters (char x line)		20 x 4
Character configuration		5 x 8 dot matrix
Character height (mm)		4.84
Character width (mm)		2.35
Character pitch (mm)		3.75
Line pitch (mm)		8.71
Dot size (mm)	width	0.39
	height	0.52
Dot pitch (mm)	width	0.49
	height	0.52
Peak wavelength of illumination		Green (505 nm) x = 0.250, y = 0.440
Luminance (cd/m^2 / fL)	min.	350 / 102
	typ.	500 / 146

4.2 MECHANICAL DRAWINGS



STANDARD NAME	DOCUMENT NUMBER:	REV: 00

4.4 ENVIRONMENTAL SPECIFICATIONS

Item	Symbol	Min.	Max.	Unit	Comment
Operating temperature	Topr	-40	+85	°C	
Storage temperature	Tstg	-50	+95	°C	
Operating humidity	Hopr	20	85	%RH	Without condensation
Storage humidity	Hstg	20	90	%RH	Without condensation
Vibration	--	--	4	G	Total amplitude: 1.5mm Freq: 10 - 55 Hz sine wave Sweep time: 1 min./cycle Duration: 2 hrs./axis (X,Y,Z)
Shock	--	--	40	G	Duration: 11ms Waveform: half sine wave 3 times/axis (X,Y,Z,-X,-Y,-Z)

4.5 ABSOLUTE MAXIMUM SPECIFICATIONS

Item	Symbol	Min.	Max.	Unit
Supply voltage	V_{CC}	-0.3	6.5	V
Input signal voltage	V_{IN}	-0.3	V_{CC} +0.3	V

4.6 DC ELECTRICAL SPECIFICATIONS

Item	Symbol	Min.	Typ.	Max.	Unit
Supply voltage	V_{CC}	4.5	5.0	5.5	V
Supply current	I_{CC}	-	310	440	mA
High-level input voltage (see Note) (E,R/W,RD/,SCK,RST/)	V_{IH1}	0.8*V_{CC}	-	V_{CC}	V
Low-level input voltage (see Note) (E,R/W,RD/,SCK,RST/)	V_{IL1}	0.0	-	0.2*V_{CC}	V
High-level input voltage (see Note) (all inputs except E,R/W,RD/,SCK,RST/)	V_{IH2}	0.7*V_{CC}	-	V_{CC}	V
Low-level input voltage (see Note) (all inputs except E,R/W,RD/,SCK,RST/)	V_{IL2}	0.0	-	0.3*V_{CC}	V
High-level output voltage (I_{OH} = -0.1mA)	V_{OH}	V_{CC}-0.5	-	-	V
Low-level output voltage (I_{OL} = 0.1mA)	V_{OL}	-	-	0.5	V
Input current (see Note)	I_I	-500	-	1.0	uA

Note: A 10K ohm pull-up resistor is provided on each input for TTL compatibility.

4.7 AC ELECTRICAL SPECIFICATIONS

4.7.1 RESET TIMING

(See Figures 1 and 2)

Item	Symbol	Min.	Max.	Unit
V_{CC} rise time	t_{RVCC}	-	10	ms
V_{CC} off time	t_{OFF}	1	-	ms
Delay time after power-up reset	t_{IRSTD}	100	-	us
Delay time after external reset	t_{ERSTD}	100	-	us
RST/ pulse width low	t_{RSTL}	500	-	ns
Input signal fall time	t_f	-	15	ns
Input signal rise time	t_r	-	15	ns

Note: All timing is specified using 20% and 80% of V_{CC} as the reference points.

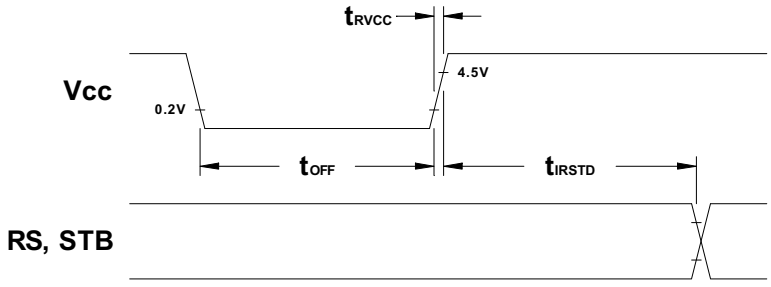

Figure 1. Power-up Internal Reset Timing

4.7.3 INTEL I80-TYPE PARALLEL INTERFACE TIMING

(See Figures 5 and 6)

Item	Symbol	Min.	Max.	Unit
RS setup time	t_{RSS}	10	-	ns
RS hold time	t_{RSH}	10	-	ns
Input signal fall time	t_f	-	15	ns
Input signal rise time	t_r	-	15	ns
WR/ pulse width low	t_{WRL}	30	-	ns
WR/ pulse width high	t_{WRH}	100	-	ns
Write data setup time	t_{DSi}	30	-	ns
Write data hold time	t_{DHi}	10	-	ns
WR/ cycle time	t_{CYCWR}	200	-	ns
RD/ cycle time	t_{CYCRD}	200	-	ns
RD/ pulse width low	t_{RDL}	70	-	ns
RD/ pulse width high	t_{RDH}	100	-	ns
Read data delay time	t_{DDi}	-	70	ns
Read data hold time	t_{DHRi}	5	80	ns

Note: All timing is specified using 20% and 80% of V_{CC} as the reference points.

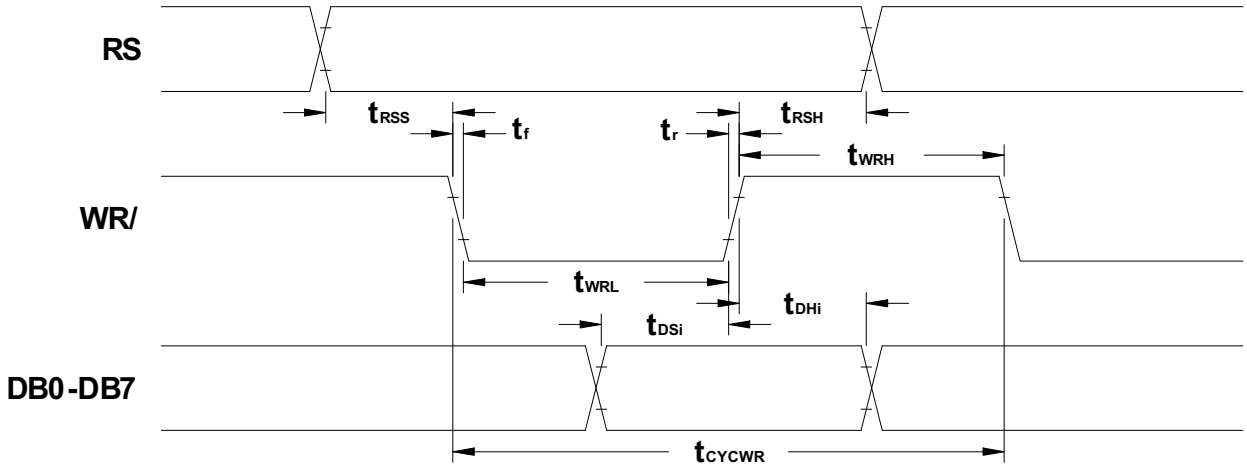

Figure 5. Intel I80-Type Parallel Interface Write Cycle Timing

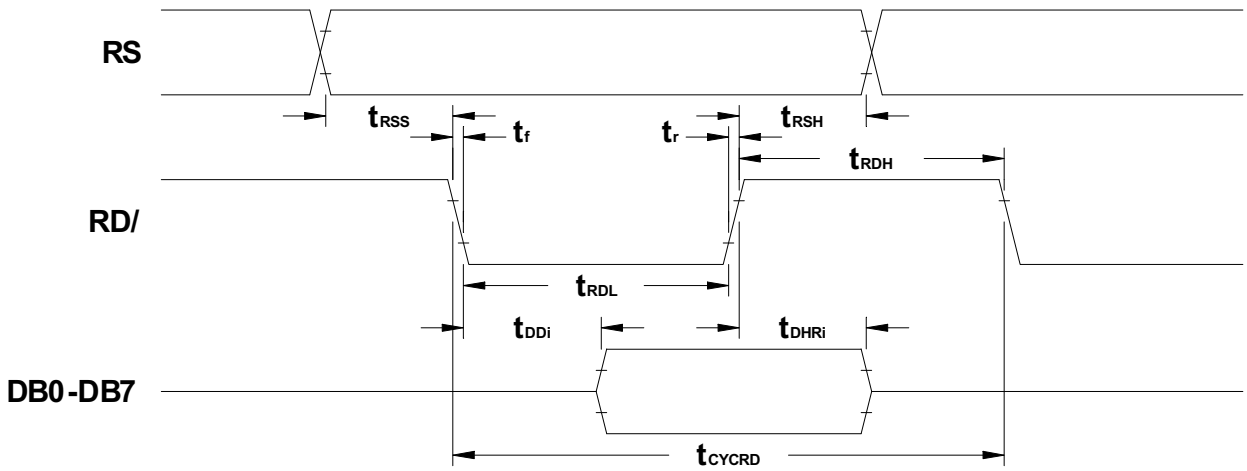

Figure 6. Intel I80-Type Parallel Interface Read Cycle Timing

4.7.4 SYNCHRONOUS SERIAL INTERFACE TIMING

(See Figures 7, 8 and 12)

Item	Symbol	Min.	Max.	Unit
STB setup time	t_{STBS}	100	-	ns
STB hold time	t_{STBH}	500	-	ns
Input signal fall time	t_f	-	15	ns
Input signal rise time	t_r	-	15	ns
STB pulse width high	t_{WSTB}	500	-	ns
SCK pulse width high	t_{SCKH}	200	-	ns
SCK pulse width low	t_{SCKL}	200	-	ns
SI data setup time	t_{DSs}	100	-	ns
SI data hold time	t_{DHs}	100	-	ns
SCK cycle time	t_{CYCSCK}	500	-	ns
SCK wait time between bytes	t_{WAIT}	1	-	us
SO data delay time	t_{DDs}	-	150	ns
SO data hold time	t_{DHRs}	5	-	ns

Note: All timing is specified using 20% and 80% of V_{CC} as the reference points.

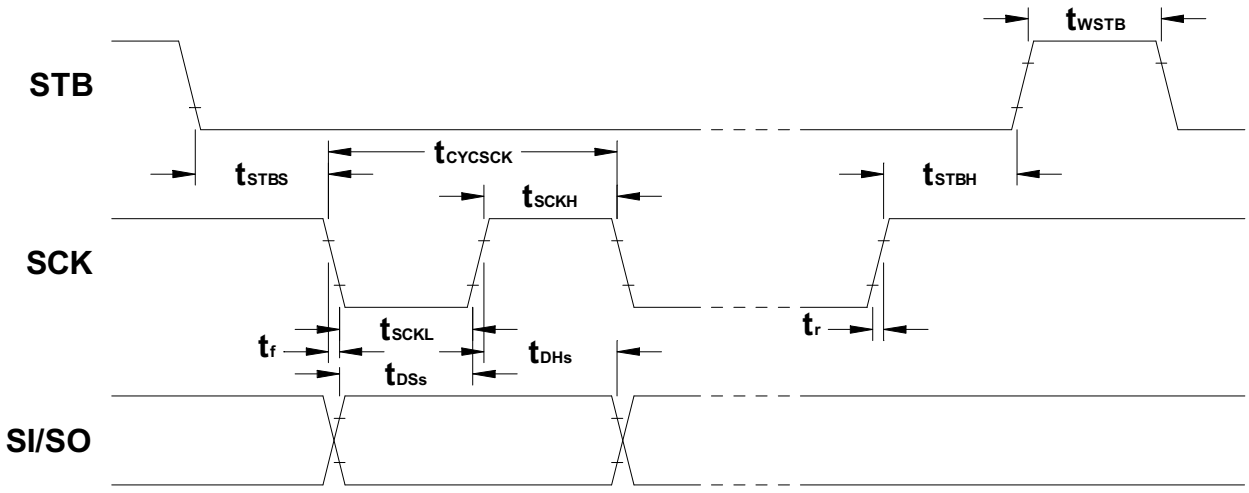

Figure 7. Synchronous Serial Interface Write Cycle Timing

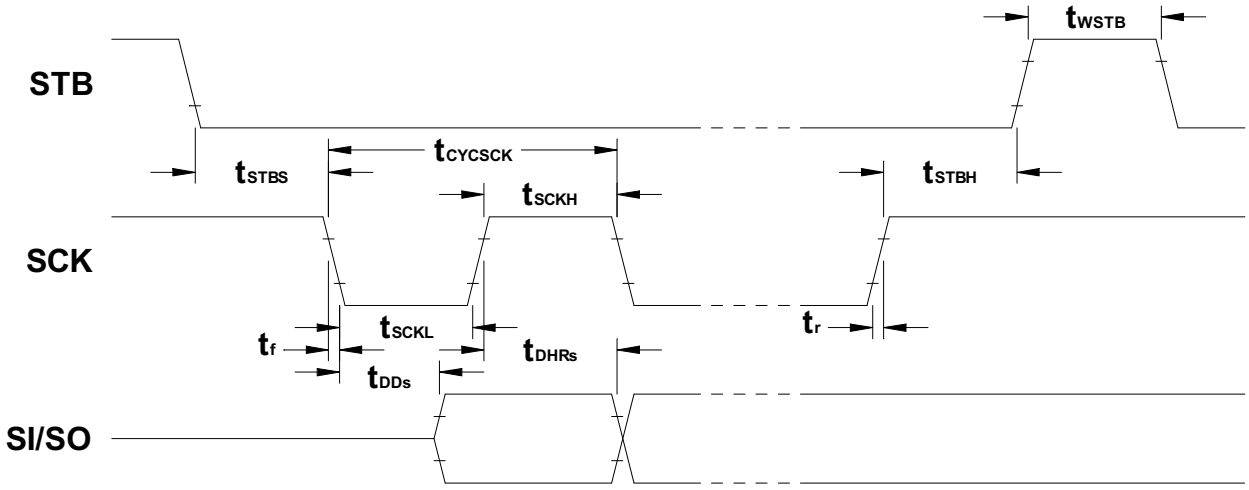

Figure 8. Synchronous Serial Interface Read Cycle Timing

5.0 MODES OF OPERATION

The following modes of operation are selectable via jumpers (see section 9.0 Jumper Settings).

5.1 PARALLEL INTERFACE MODES

In the parallel interface mode, 8-bit instructions and data are sent between the host and the modules using either 4-bit nibbles or 8-bit bytes. Nibbles are transmitted high nibble first on DB4-DB7 (DB0-DB3 are ignored) whereas bytes are transmitted on DB0-DB7. The Register Select (RS) control signal is used to identify DB0-DB7 as an instruction (low) or data (high).

5.1.1 MOTOROLA M68-TYPE MODE

This mode uses the Read/Write (R/W) and Enable (E) control signals to transfer information. Instructions/data are written to the module on the falling edge of E when R/W is low and are read from the module after the rising edge of E when R/W is high.

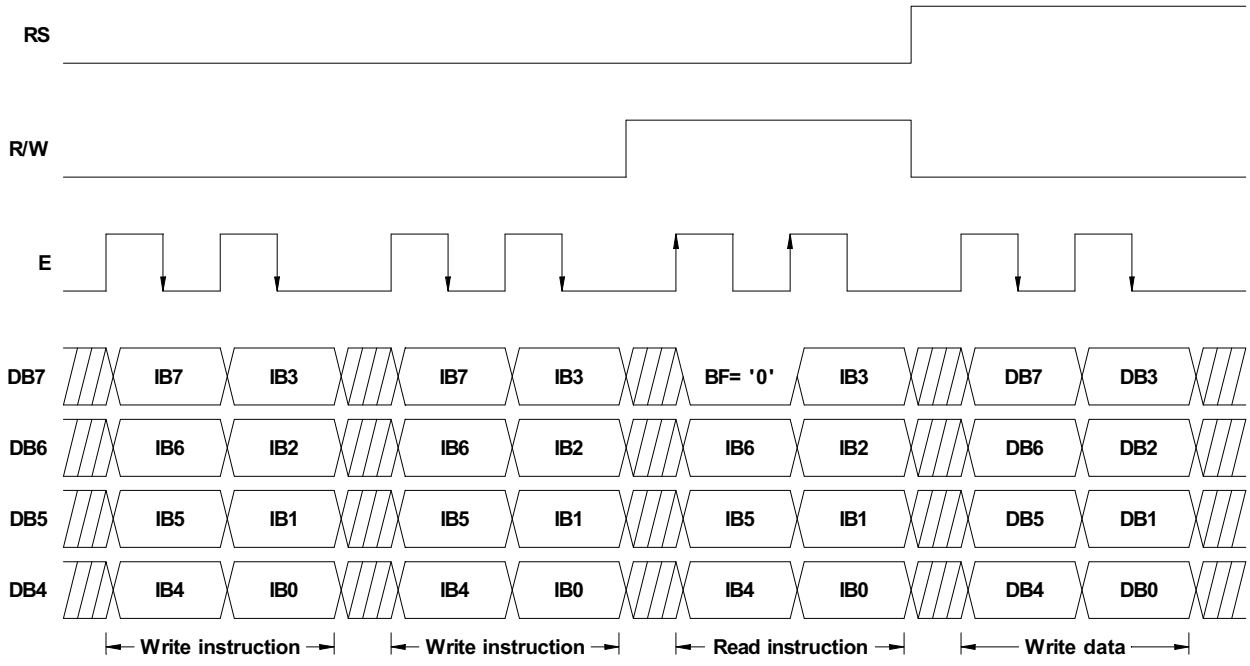

Figure 9. Typical 4-Bit Parallel Interface Sequence Using M68-Type Mode

5.1.2 INTEL I80-TYPE MODE

This mode uses the Read (RD/) and Write (WR/) control signals to transfer information. Instructions/data are written to the module on the rising edge of WR/ and are read from the modules after the falling edge of RD/.

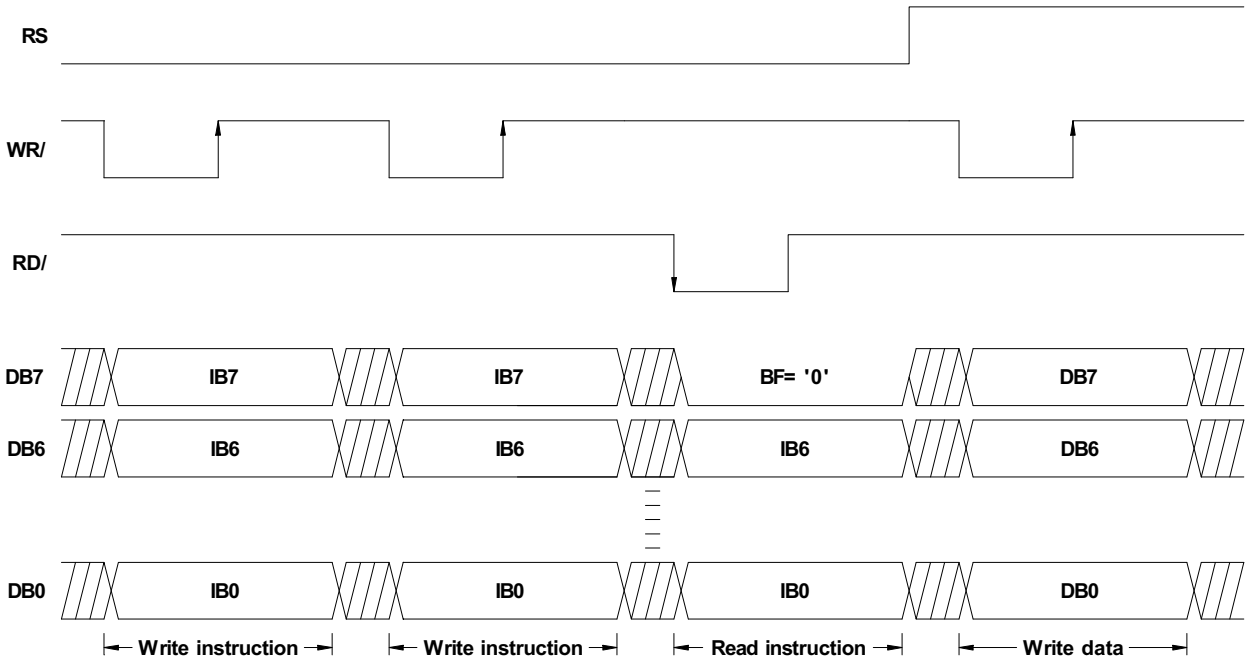

Figure 10. Typical 8-Bit Parallel Interface Sequence Using I80-Type Mode

5.2 SYNCHRONOUS SERIAL INTERFACE MODE

In the synchronous serial interface mode, instructions and data are sent between the host and the module using 8-bit bytes. Two bytes are required per read/write cycle and are transmitted MSB first. The start byte contains 5 high bits, the Read/Write (R/W) control bit, the Register Select (RS) control bit, and a low bit. The following byte contains the instruction/data bits. The R/W bit determines whether the cycle is a read (high) or a write (low) cycle. The RS bit is used to identify the second byte as an instruction (low) or data (high).

This mode uses the Strobe (STB) control signal, Serial Clock (SCK) input, and Serial I/O (SI/SO) line to transfer information. In a write cycle, bits are clocked into the modules on the rising edge of SCK. In a read cycle, bits in the start byte are clocked into the modules on the rising edge of SCK. After the minimum wait time, each bit in the instruction/data byte can be read from the modules after each falling edge of SCK. Each read/write cycle begins on the falling edge of STB and ends on the rising edge. To be a valid read/write cycle, the STB must go high at the end of the cycle.

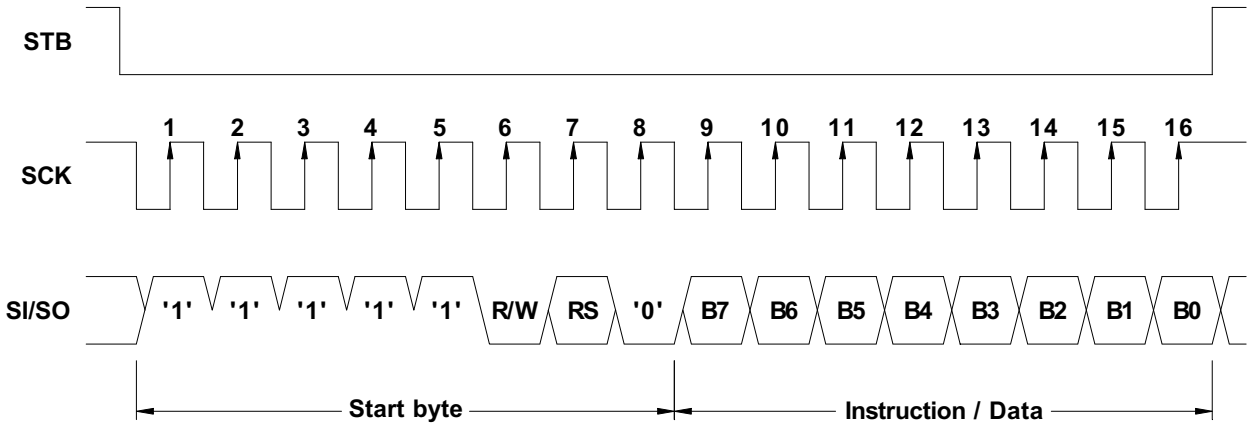

Figure 11. Typical Synchronous Serial Interface Write Cycle

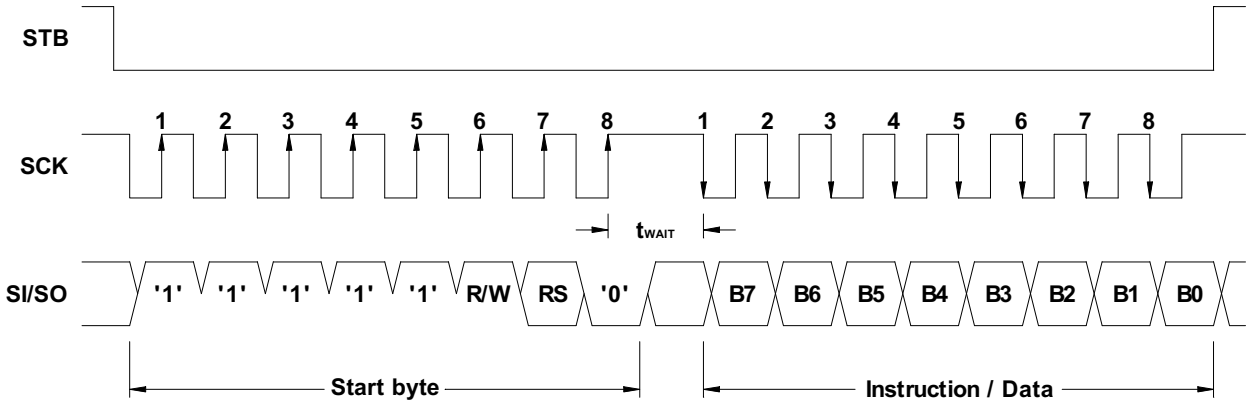

Figure 12. Typical Synchronous Serial Interface Read Cycle

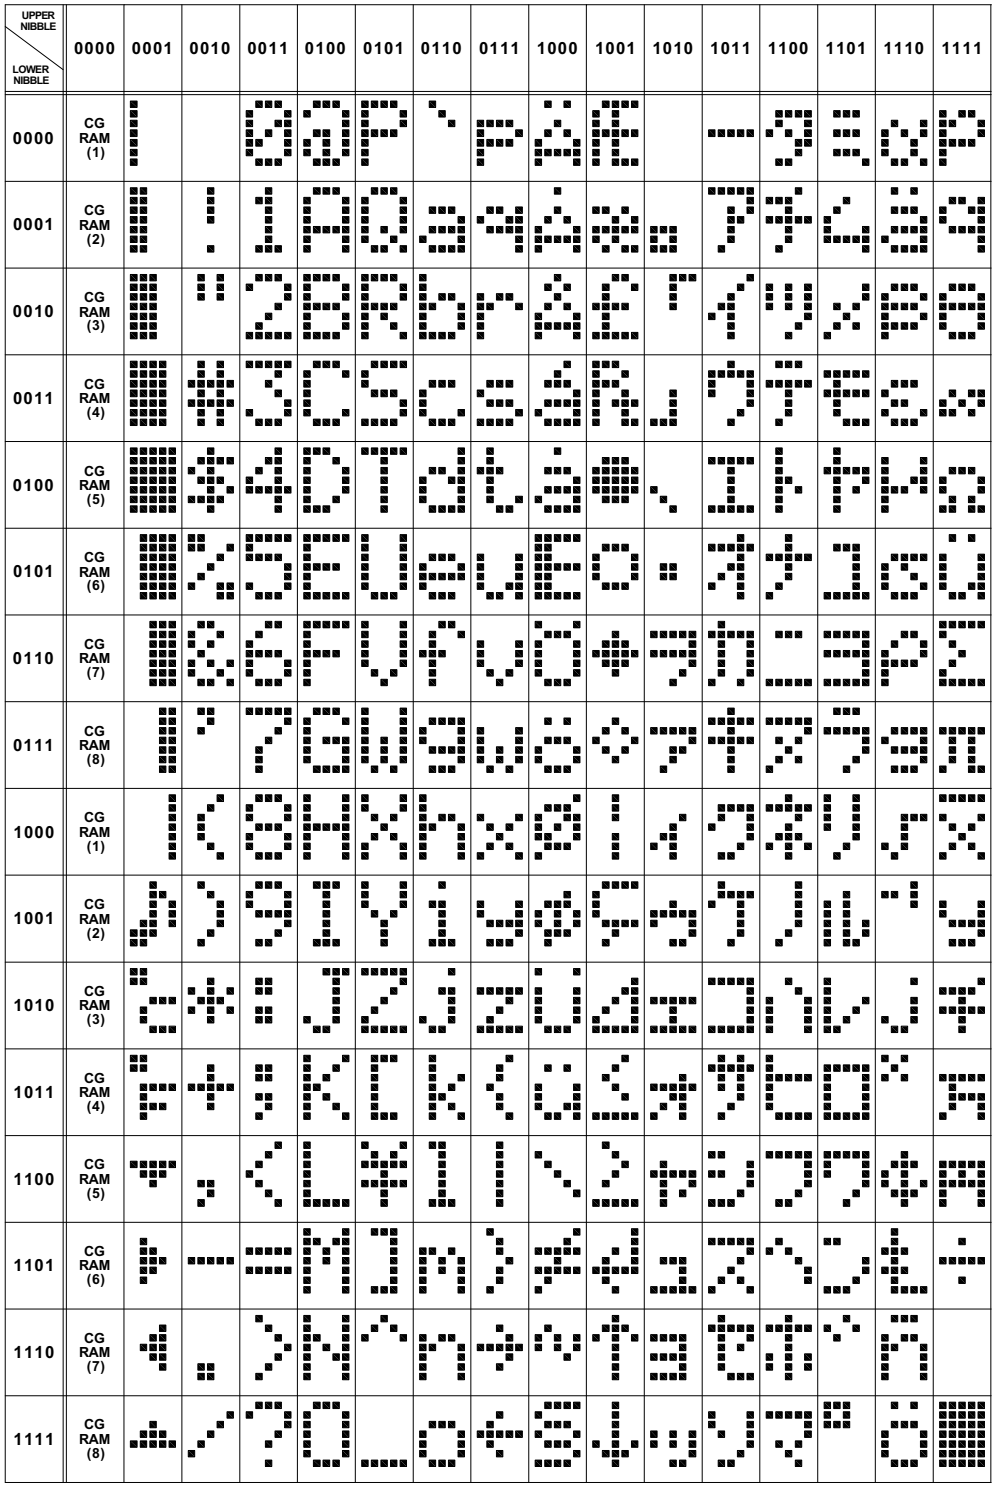
5.3 RESET MODES

The module is reset automatically at power-up by an internal R-C circuit. However, an external reset mode can also be selected when using one of the parallel interface modes (this option is not available when using the synchronous serial interface mode). This mode allows the module to be reset by setting the Reset (RST/) input low.

6.0 CHARACTER FONT TABLE



7.0 FUNCTIONAL DESCRIPTION

7.1 ADDRESS COUNTER (AC)

7.1.1 SINGLE LINE DISPLAYS

The AC stores the address of the data being written to and read from DDRAM or CGRAM. The AC increments by 1 (overflows from 4FH to 00H) or decrements by 1 (underflows from 00H to 4FH) after each DDRAM access. The AC increments by 1 (overflows from 3FH to 00H) or decrements by 1 (underflows from 00H to 3FH) after each CGRAM access. When addressing DDRAM, the value in the AC also represents the cursor position.

7.1.2 MULTIPLE LINE DISPLAYS

The AC stores the address of the data being written to and read from DDRAM or CGRAM. The AC increments by 1 (overflows from 27H to 40H and from 67H to 00H) or decrements by 1 (underflows from 40H to 27H and from 00H to 67H) after each DDRAM access. The AC increments by 1 (overflows from 3FH to 00H) or decrements by 1 (underflows from 00H to 3FH) after each CGRAM access. When addressing DDRAM, the value in the AC also represents the cursor position.

7.2 DISPLAY DATA RAM (DDRAM)

7.2.1 SINGLE LINE DISPLAYS

The DDRAM stores the character code of each character being displayed on the VFD. Valid DDRAM addresses are 00H to 4FH. DDRAM not being used for display characters can be used as general purpose RAM. The tables below show the relationship between the DDRAM address and the character position on the VFD before and after a display shift (with the number of display lines set to 1).

7.2.2 MULTIPLE LINE DISPLAYS

The DDRAM stores the character code of each character being displayed on the VFD. Valid DDRAM addresses are 00H to 27H and 40H to 67H. DDRAM not being used for display characters can be used as general purpose RAM. The tables below show the relationship between the DDRAM address and the character position on the VFD before and after a display shift (with the number of display lines set to 2).

7.3 DISPLAY SHIFT DETAIL

Relationship before a display shift (non-shifted):

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E	0F	10	11	12	13
2	40	41	42	43	44	45	46	47	48	49	4A	4B	4C	4D	4E	4F	50	51	52	53
3	14	15	16	17	18	19	1A	1B	1C	1D	1E	1F	20	21	22	23	24	25	26	27
4	54	55	56	57	58	59	5A	5B	5C	5D	5E	5F	60	61	62	63	64	65	66	67

Relationship after a display shift to the left:

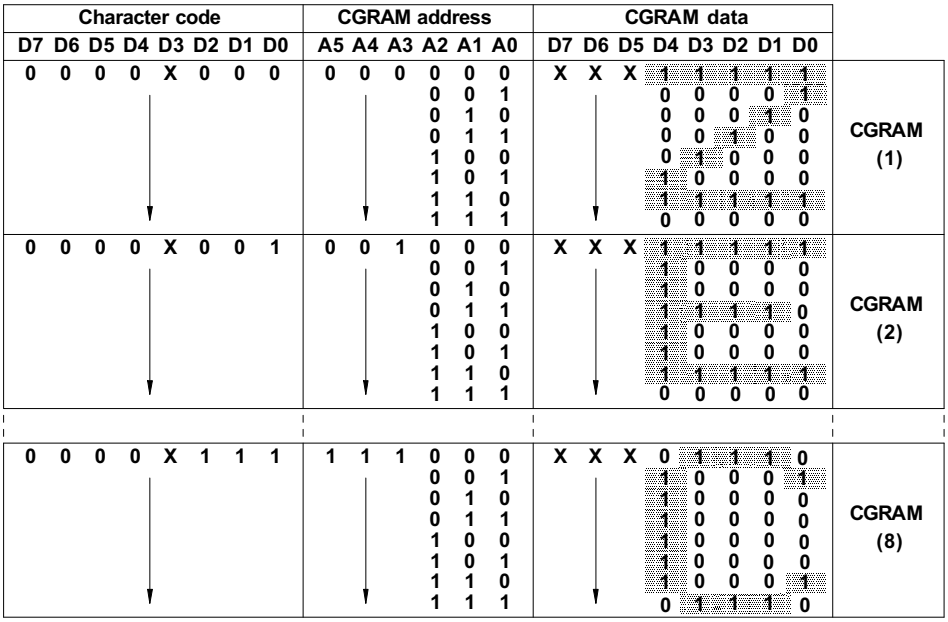
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E	0F	10	11	12	13	14
2	41	42	43	44	45	46	47	48	49	4A	4B	4C	4D	4E	4F	50	51	52	53	54
3	15	16	17	18	19	1A	1B	1C	1D	1E	1F	20	21	22	23	24	25	26	27	00
4	55	56	57	58	59	5A	5B	5C	5D	5E	5F	60	61	62	63	64	65	66	67	40

Relationship after a display shift to the right:

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	27	00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E	0F	10	11	12
2	67	40	41	42	43	44	45	46	47	48	49	4A	4B	4C	4D	4E	4F	50	51	52
3	13	14	15	16	17	18	19	1A	1B	1C	1D	1E	1F	20	21	22	23	24	25	26
4	53	54	55	56	57	58	59	5A	5B	5C	5D	5E	5F	60	61	62	63	64	65	66

7.4 CHARACTER GENERATOR RAM (CGRAM)

The CGRAM stores the pixel information (1 = pixel on, 0 = pixel off) for the eight user-definable 5x8 characters. Valid CGRAM addresses are 00H to 3FH. CGRAM not being used to define characters can be used as general purpose RAM (lower 5 bits only). Character codes 00H to 07H (or 08H to 0FH) are assigned to the user-definable characters (see section 5.0 Character Font Tables). The table below shows the relationship between the character codes, CGRAM addresses, and CGRAM data for each user-definable character.



x = don't care

7.5 INSTRUCTIONS

Instruction	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Clear display	0	0	0	0	0	0	0	0	0	1
Cursor home	0	0	0	0	0	0	0	0	1	x
Entry mode set	0	0	0	0	0	0	0	1	I/D	S
Display on/off control	0	0	0	0	0	0	1	D	C	B
Cursor/display shift	0	0	0	0	0	1	S/C	R/L	x	x
Function set	0	0	0	0	1	DL	N	x	BR1	BR0
CGRAM address set	0	0	0	1	CGRAM address					
DDRAM address set	0	0	1	DDRAM address						
Address counter read	0	1	BF=0	AC contents						
DDRAM or CGRAM write	1	0	Write data							
DDRAM or CGRAM read	1	1	Read data							

x = don’t care

7.5.1 CLEAR DISPLAY

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	1

This instruction clears the display (without affecting the contents of CGRAM) by performing the following:

1) Fills all DDRAM locations with character code 20H (character code for a space).
2) Sets the AC to DDRAM address 00H (i.e. sets cursor position to 00H).
3) Returns the display to the non-shifted position.
4) Sets the I/D bit to 1.

7.5.2 CURSOR HOME

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	x

x = don't care

This instruction returns the cursor to the home position (without affecting the contents of DDRAM or CGRAM) by performing the following:

1) Sets the AC to DDRAM address 00H (i.e. sets cursor position to 00H).
2) Returns the display to the non-shifted position.

7.5.3 ENTRY MODE SET

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	I/D	S

This instruction selects whether the AC (cursor position) increments or decrements after each DDRAM or CGRAM access and determines the direction the information on the display shifts after each DDRAM write. The instruction also enables or disables display shifts after each DDRAM write (information on the display does not shift after a DDRAM read or CGRAM access). DDRAM, CGRAM, and AC contents are not affected by this instruction.

I/D = 0: The AC decrements after each DDRAM or CGRAM access. If S = 1, the information on the display shifts to the right by one character position after each DDRAM write.
I/D = 1: The AC increments after each DDRAM or CGRAM access. If S = 1, the information on the display shifts to the left by one character position after each DDRAM write.

S = 0: The display shift function is disabled.
S = 1: The display shift function is enabled.

7.5.4 DISPLAY ON/OFF CONTROL

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	C	B

This instruction selects whether the display and cursor are on or off and selects whether or not the character at the current cursor position blinks. DDRAM, CGRAM, and AC contents are not affected by this instruction.

D = 0: The display is off (display blank).
D = 1: The display is on (contents of DDRAM displayed).

C = 0: The cursor is off.
C = 1: The cursor is on (8^{th} row of pixels).

B = 0: The blinking character function is disabled.
B = 1: The blinking character function is enabled (a character with all pixels on will alternate with the character displayed at the current cursor position at about a 1Hz rate with a 50% duty cycle).

7.5.5 CURSOR/DISPLAY SHIFT

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	x	x

x = don't care

This instruction increments or decrements the AC (cursor position) and shifts the information on the display one character position to the left or right without accessing DDRAM or CGRAM. DDRAM and CGRAM contents are not affected by this instruction. If the AC was addressing CGRAM prior to this instruction, the AC will be addressing DDRAM after this instruction. However, if the AC was addressing DDRAM prior to this instruction, the AC will still be addressing DDRAM after this instruction.

S/C	R/L	AC contents (cursor position)	Information on the display
0	0	Decrements by one	No change
0	1	Increments by one	No change
1	0	Decrements by one	Shifts one character position to the left
1	1	Increments by one	Shifts one character position to the right

7.5.6 FUNCTION SET

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	N	x	BR1	BR0

x = don't care

This instruction sets the width of the data bus for the parallel interface modes, the number of display lines, and the luminance level (brightness) of the VFD. It must be the first command sent after any reset. DDRAM, CGRAM, and AC contents are not affected by this instruction.

DL = 0: Sets the data bus width for the parallel interface modes to 4-bit (DB7-DB4).
DL = 1: Sets the data bus width for the parallel interface modes to 8-bit (DB7-DB0).

N = 0: Sets the number of display lines to 1 (this setting is not recommended for multiple line displays).
N = 1: Sets the number of display lines to 2 (this setting is not recommended for single line displays).

BR1,BR0 = 0,0: Sets the luminance level to 100%.
0,1: Sets the luminance level to 75%.
1,0: Sets the luminance level to 50%.
1,1: Sets the luminance level to 25%.

7.5.7 CGRAM ADDRESS SET

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	CGRAM address					

This instruction places the 6-bit CGRAM address specified by DB5-DB0 into the AC (cursor position). Subsequent data writes (reads) will be to (from) CGRAM. DDRAM and CGRAM contents are not affected by this instruction.

7.5.8 DDRAM ADDRESS SET

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	DDRAM address						

This instruction places the 7-bit DDRAM address specified by DB6-DB0 into the AC (cursor position). Subsequent data writes (reads) will be to (from) DDRAM. DDRAM and CGRAM contents are not affected by this instruction.

7.5.9 ADDRESS COUNTER READ

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BF=0	AC contents						

This instruction reads the current 7-bit address from the AC on DB6-DB0 and the busy flag (BF) bit (always 0) on DB7. DDRAM, CGRAM, and AC contents are not affected by this instruction. Because the BF is always 0, the host never has to read the BF bit to determine if the modules are busy before sending data or instructions. Therefore, data and instructions can be sent to the module continuously according to the E, WR/, and SCK cycle times specified in section 3.7 AC Timing Specifications. Due to this feature, the execution times for each instruction are not specified.

7.5.10 DDRAM OR CGRAM WRITE

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	Write data							

This instruction writes the 8-bit data byte on DB7-DB0 into the DDRAM or CGRAM location addressed by the AC. The most recent DDRAM or CGRAM Address Set instruction determines whether the write is to DDRAM or CGRAM. This instruction also increments or decrements the AC and shifts the display according to the I/D and S bits set by the Entry Mode Set instruction.

7.5.11 DDRAM OR CGRAM READ

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	Read data							

This instruction reads the 8-bit data byte from the DDRAM or CGRAM location addressed by the AC on DB7-DB0. The most recent DDRAM or CGRAM Address Set instruction determines whether the read is from DDRAM or CGRAM. This instruction also increments or decrements the AC and shifts the display according to the I/D and S bits set by the Entry Mode Set instruction. Before sending this instruction, a DDRAM or CGRAM Address Set instruction should be executed to set the AC to the desired DDRAM or CGRAM address to be read.

7.6 RESET CONDITIONS

After either a power-up reset or an external reset, the module initializes to the following conditions:

1) All DDRAM locations are set to 20H (character code for a space).
2) The AC is set to DDRAM address 00H (i.e. sets cursor position to 00H).
3) The relationship between DDRAM addresses and character positions on the VFD is set to the non-shifted position.
4) Entry Mode Set instruction bits:
   - I/D = 1: The AC increments after each DDRAM or CGRAM access.
   - S = 0: The display shift function is disabled.
5) Display On/Off Control instruction bits:
   - D = 0: The display is off (display blank).
   - C = 0: The cursor is off.
   - B = 0: The blinking character function is disabled.
6) Function Set instruction bits:
   - DL = 1: Sets the data bus width for the parallel interface modes to 8-bit (DB7-DB0).
   - N = 1(0): Number of display lines set to 2 for multiple line displays (number of display lines set to 1 for single line displays).
   - BR1,BR0 = 0,0: Sets the luminance level to 100%.

Note that the function set command must be the first instruction sent to the module after any reset.

7.6.1 INITIALIZATION

The module can be initialized by using instructions if the module is not reset according to the reset timing detailed in Section 3.7.1 (Reset Timing). After any reset, the function set command must be the first instruction sent to the module.

8.0 CONNECTOR INTERFACE

Pin No.	Serial	Parallel (Intel)	Parallel (Motorola)	Pin No.	Serial	Parallel (Intel)	Parallel (Motorola)
